

Evaluation 2: harder matched-scene controls

Six original source scenes; 108 terminal conditions across 50/70/90% branch time and original/parked arms. Four test scenes per cell. Original thresholds and fusion coefficients are unchanged; exact original-cell prediction parity verified. This is a follow-up robustness check, not a fresh independent test set.

Branch	Arms	Test success/incomplete	DT BA	S3 BA	DT+S3 BA	DINO BA
50% original	4/8	1.000	1.000	1.000	1.000	
50% parked	4/8	0.562	0.500	0.500	0.500	
70% original	5/7	0.900	0.900	0.900	0.900	
70% parked	6/6	0.500	0.500	0.500	0.500	
90% original	12/0	undefined	undefined	undefined	undefined	
90% parked	12/0	undefined	undefined	undefined	undefined	

90% conditions have no negative examples. Success recall:
original: DT 0.333, S3 0.333, DT + S3 0.333, DINOv2 0.333
parked: DT 1.000, S3 1.000, DT + S3 1.000, DINOv2 1.000

All generated states/labels validated against pinned ABC. Goals are shared successful endpoints from the same source scene. Common-pose motion preserves the original object state at onset and moves objects only through physics; actual outcomes are re-evaluated. One 70% hold branch changes from incomplete to complete during the added continuation. There is no equal-duration no-motion control; the parked condition changes both robot pose and available settling time. All 90% branches remain successful, so they are disturbed-arm positive controls, not failure data.

Uncertainty and every method/confusion matrix: `difficulty_metrics.json`. Intervals resample four source scenes; samples across cells/modes are correlated.

Full metrics and source-cluster intervals
